Early mobilisation in fractures and fracture-dislocations of the elbow joint
Stable, controlled movement round the axis of rotation of the elbow joint

Immediate pronation and supination

Early flexion and extension

Well tolerated by the patient

Controlled distraction of the joint possible

Extended Range Clamp increases choice of angle of ulnar screws

Also indicated for the treatment of stiff elbows

Indications
- Intra-articular fractures
- Fracture-dislocations requiring further stabilisation after treatment
- Post-traumatic stiffness

Literature:

For further ordering information see section “Elbow Fixator” in the Orthofix General Catalogue
